Galileo looks for sign of life on Europa

PASADENA, Calif. - The Galileo spacecraft swooped within 124 miles of Jupiter's frozen moon Europa, getting its closest look at a planetary body that scientists believe may harbor life. Europa has become a major target for exploration because its icy surface is likely concealing two elements needed to support life: water and heat. Scientists will have to wait a few weeks to get the latest pictures snapped by Galileo, but instruments recently detected signs of magnesium salts that bolstered the belief that an ocean could be under Europa's cracked-ice surface.

Planes search for meteor in Greenland

COPENHAGEN, Denmark - Danish Air Force planes are searching snow-covered southern Greenland for traces of a meteor believed to have struck the island on Dec. 9. Around 5 a.m., three fishermen working off the east coast saw a giant flash in the dark sky. A parking lot surveillance camera on the west coast picked up the same phenomenon. Astronomers say there's a good chance it was a giant meteor, but heavy snowfall may have already covered it and its crater.

The race to save the tiger from extinction

Powdered tiger bone has been used for thousands of years in traditional East Asian medicine as a treatment for arthritis. Demand for it today, and for other tiger body parts, threatens to destroy the world's remaining wild tigers. A conference is being held this week with practitioners of traditional Chinese medicine to discuss alternatives to tiger-based products and help preserve the species. Where there were once over 100,000 tigers in the wild, only 5,000 to 7,000 remain worldwide.
